

Embeds binding template mechanism as described in

WoT Binding Template 2.0 (REC)

- Main entry point to the binding concept
- Describes the binding mechanism (**communication protocol**, **payload/contentType**, and **ecosystems** (combines payload & protocol) like Philipps Hue & OPC UA)
- **Specifies the expectations & requirements as assertions**
- provides the link (a registry?) to the actual protocol / payload / ecosystem binding description (is a non-normative section which allows to update the registry)

W3C Note / REC? / Defined in a subsection of a standard (e.g. Profile) / May also be defined by other SDOs

TD & TM 2.0 REC vs TD 2.0 REC & TM 2.0 REC

DRAFT

TD&TM 2.0
(REC)

- TM/TD should be better conceptual designed in the document.
→ Begin with TM and then go to TD (however, TM can be also seen as an extension of a TD)

+ not another REC for TM

TD 2.0 (REC)

TM 2.0 (REC)

- + Lightweight documents
- + Easier to find “Thing Model” definitions
- + Standalone documents are more suitable for newcomers
- + TM can maintain its own ontology definition (which will be the identical one as the TD ontology, however, uses a different namespace)

- Too many duplicated definitions?
- complicate to sync
- Too many RECs

Basic Structure of TD & TM 2.0 REC

DRAFT
